

Features

- ESD protection for one line with uni-direction
- Provide transient protection for the protected line to
 - IEC 61000-4-2 (ESD) $\pm 20\text{kV}$ (air/contact)**
 - IEC 61000-4-4 (EFT) 80A (5/50ns)**
 - IEC 61000-4-5 (Lightning) 13A (8/20 μs)**
- Ultra-low capacitance: 0.85pF typical
- 0402 small DFN package saves board space
- **High breakdown voltage** to provide over-voltage protection on USB 2.0 D+/D- pins
- Fast turn-on and low clamping voltage
- For low operating voltage applications: 3.3V
- Solid-state silicon-avalanche and active circuit triggering technology
- **Green part**

Applications

- USB 2.0
- USB Type-C D+/D- pins
- Handheld portable applications
- Data and I/O lines protection
- Analog input lines protection
- Video lines protection

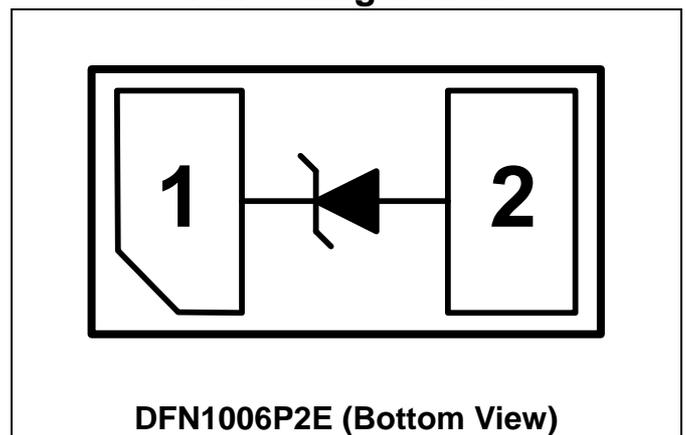

Description

AZ5H33-01F is a design which includes a uni-directional surge rated clamping cell to protect high-speed data interfaces in an electronic system. The AZ5H33-01F has been specifically designed to protect sensitive components which are connected to data and transmission lines from over-voltage caused by Electrostatic Discharging (ESD), Electrical Fast Transients (EFT), Lightning, and Cable Discharge Event (CDE).

AZ5H33-01F is a unique design which includes proprietary clamping cell in a single package. During transient conditions, the proprietary clamping cell prevents over-voltage on the data lines, which is protecting any downstream components.

AZ5H33-01F may be used to meet the ESD immunity requirements of IEC 61000-4-2, Level 4 ($\pm 15\text{kV}$ air, $\pm 8\text{kV}$ contact discharge).

Note 1: The Peak Pulse Current measured conditions: $t_p = 8/20\mu\text{s}$, 2ohm source impedance.

Note 2: ESD Clamping Voltage was measured by Transmission Line Pulsing (TLP) System.

TLP conditions: $Z_0=50\Omega$, $t_p=100\text{ns}$, $t_r=1\text{ns}$.

Typical Characteristics

Application Information

The AZ5H33-01F is designed to protect one line against system ESD / EFT / Lightning pulses by clamping it to an acceptable reference. It provides uni-directional protection.

The usage of the AZ5H33-01F is shown in Fig. 1. Protected lines, such as data line, control line, or power line, is connected to pin 1. The pin 2 should be connected to a ground plane on the board. In order to minimize parasitic inductance in the board traces, all path lengths connected to the pins of AZ5H33-01F should be kept as short as possible.

In order to obtain enough suppression of ESD induced transient, a good circuit board is critical. Thus, the following guidelines are recommended:

- Minimize the path length between the protected lines and the AZ5H33-01F.
- Place the AZ5H33-01F near the input terminals or connectors to restrict transient coupling.
- The ESD current return path to ground should be kept as short as possible.
- Use ground planes whenever possible.
- NEVER route critical signals near board edges and near the lines which the ESD transient easily injects to.
